#### Learning Experience for Assignment 1

What I've learned from this assignment: I learned how to accept keyboard input from console.

What I struggled with: One of the struggles with this assignment was making sure the output was correct, which I ended up doing by breaking the equation into multiple parts, and adding/subtracting those parts as needed. Later, I found out you can simply use parenthesis to separate out parts of the equation, but I believe that the code is much more readable with my approach.

What I'd do differently on my next project: I'd complete the design before doing any code, I finished the code before the design assignment.

What parts of the project I was successful with: I found this assignment to be relatively easy due to some past java experience, and I'd say I was successful at getting the program to work with no issues.
